Subdomain setup checklist

Every change needed so each customer's site opens at its own subdomain, such as `anna.me0.ai` (roadmap R71a). Tick each line once its check shows what the last column says. The step numbers are those of the Subdomain setup guide, which says how to make each change; its **If it doesn't work** section helps when a line can't be ticked. Source of `Subdomain-Setup-Checklist.pdf`.

Run the `docker compose` and `grep` checks on the server, in `~/ImageSkinForLLM/deploy`; the `nslookup` checks on your laptop.

✓	What	How to check	Right when
☐	me0.ai's nameservers are Cloudflare's (step 1)	`nslookup -type=NS me0.ai` on your laptop; Cloudflare's **Overview** for me0.ai	two `*.ns.cloudflare.com` names; Cloudflare says **Active**
☐	DNSSEC is off at Squarespace, or set up again in Cloudflare	Squarespace: **Domains**, **me0.ai**, **DNS**	off, or Cloudflare's **DNS**, **Settings** shows DNSSEC **Active**
☐	Every record from Squarespace is in Cloudflare (step 1.3)	Cloudflare: **DNS**, **Records**	the same `app`, email (MX, TXT) and website records
☐	`app.me0.ai` points at the machine, DNS only	`nslookup app.me0.ai`; its **Proxy status** in Cloudflare	the machine's IP; a grey cloud
☐	`*.me0.ai` points at the machine, DNS only (step 2)	`nslookup anything.me0.ai`; the `*` record's **Proxy status**	the machine's IP; a grey cloud
☐	The token can read the zone and edit its DNS (step 3)	Cloudflare: **My Profile**, **API Tokens**, the token's **Edit**	**Zone · DNS · Edit** and **Zone · Zone · Read**, for **me0.ai**; status **Active**
☐	`.env` has the domain and the token (step 4)	`grep -E "MAIN_DOMAIN|CLOUDFLARE" .env`	`MAIN_DOMAIN=me0.ai` and the whole token, with no spaces or quotes
☐	`config.toml` has the same domain (step 4)	`grep main_domain config.toml`	`main_domain = "me0.ai"`
☐	Ports 80 and 443 are open in Oracle and on the machine	Oracle: the subnet's **Default Security List**; on the machine, `sudo iptables -L INPUT -n | grep -E "dpt:(80|443)"`	ingress rules for TCP 80 and 443 from `0.0.0.0/0`; two `ACCEPT` lines
☐	Caddy has Cloudflare's module (step 5)	`docker compose exec caddy caddy list-modules | grep cloudflare`	`dns.providers.cloudflare`

✔	What	How to check	Right when
☐	Caddy's settings are valid (step 5)	`docker compose exec caddy caddy validate --config /etc/caddy/Caddyfile`	`Valid configuration`
☐	The wildcard certificate was obtained (step 6)	`docker compose logs caddy | grep -i "obtained"`	`certificate obtained successfully` for `*.me0.ai`
☐	A subdomain reaches the app (step 6)	open `https://nosuchsite.me0.ai`	a padlock and **Site not found**, with no password asked
☐	A site opens at its subdomain (step 6)	`imageskin site list`, then open one's address	that site, with the padlock
